

How many people are currently receiving BSS – National Picture?

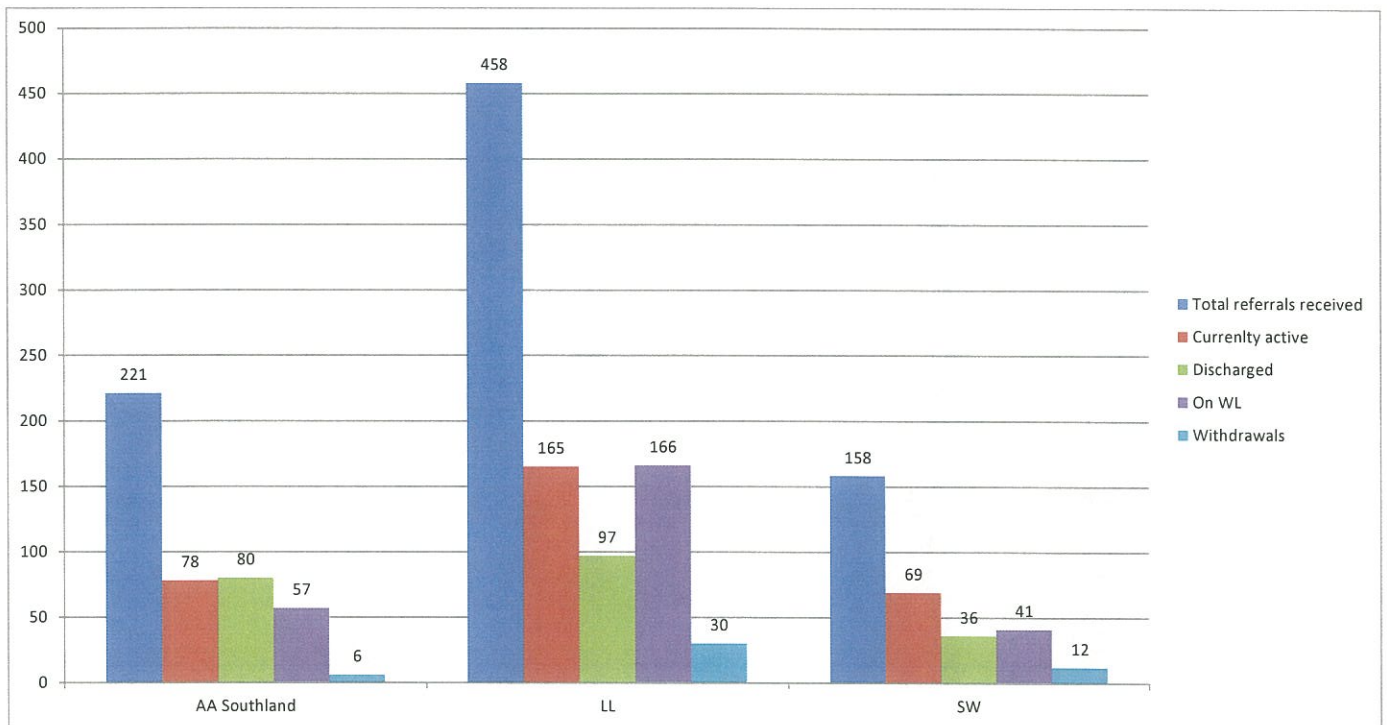

National totals

Southern region

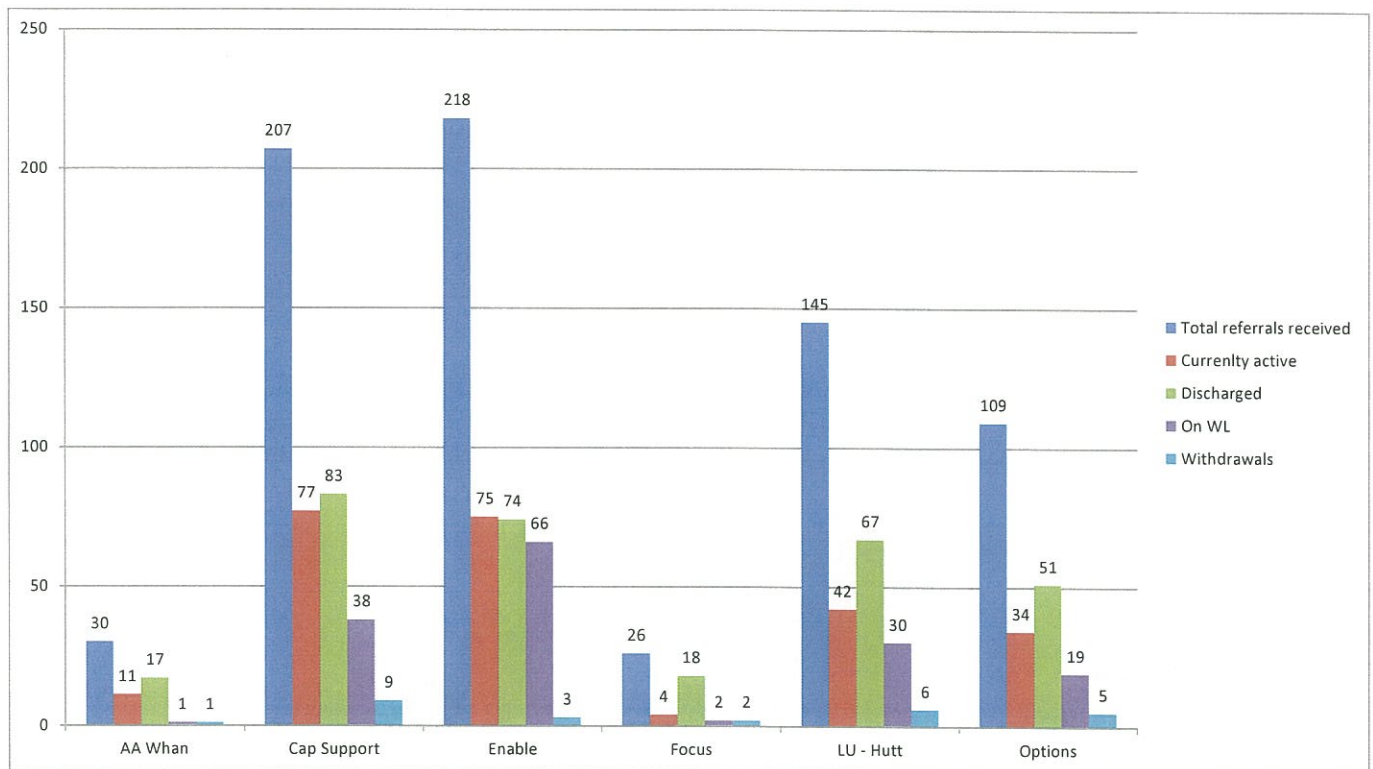

While the Lifelinks referrals have been disproportionately high in terms of the national statistics, the referrals are now nearly as one would expect proportionally to the general population.

High proportion of children referred at the age of 8 years the CDS appears to be a very high referrer, reflects the different approaches of CDS nationally.

Central region

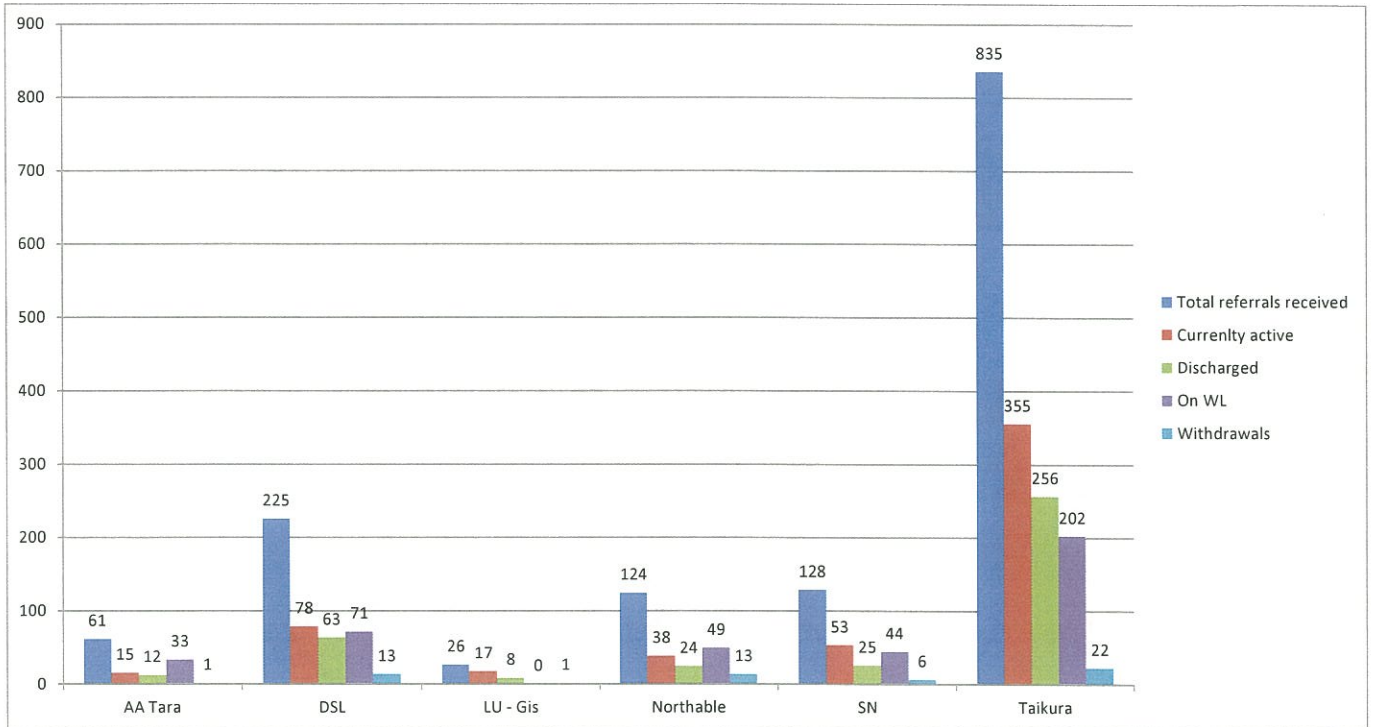

Explore are starting to look at allocating as a central resource now that referral timeframes are starting to come align within region.

Northern Region

Explore are really pleased with the reduction in the Taikura region, this was one of the country's most significant waitlists which has now reached less than 8 months with no priority 1 on the waitlist

The Midland area has had the most significant staff turnover in Explore and this has resulted in a longer than expected period of staff stabilisation; this we believe in under control with a full complement of specialists on board by the end of March.

% Referrals withdrawn

National Average =4.4%

Getting greater understanding through the new triaging system that has been in place for nearly 3 month

Managing other agencies expectations of what is the behaviour support service role.

Picking up gaps from other agencies – especially MH, Schools and CYF's
